Disputation über die Doktorarbeit von

Herrn Dipl.-Ing. Christian Schulz

Thema der Dissertation:

**Interactive Spacetime Control of Deformable Objects
and Modal Shape Analysis beyond Laplacian**

Thema der Disputation:

Geometric modeling of meshes: A model reduction approach

Die Arbeit wurde unter der Betreuung von **Prof. Dr. K. Polthier** durchgeführt.

Abstract: We present a robust and intuitive strategy for the deformation of high resolution meshes at interactive rates [1]. The deformations we consider are solutions to a non-linear optimization problem that models the elastic behavior of shapes under external forces that are controlled by the user.

Motivated by the observation that a typical modeling session requires only a fraction of the full shape space of the underlying model, an appropriate low-dimensional shape space is constructed as the feasible set for the optimization. The interactive response times are achieved by using a coarse energy approximation in combination with this reduced shape representation and further improved by using an efficient quasi-Newton solver.
