19589 - PS Telematik-Projekt: Wireless Embedded Systems

Task

Bastian Blywis

Department of Mathematics and Computer Science
Institute of Computer Science
15. April, 2009
1. Required Reading

2. Task Summary

3. Experiments

4. Topologies

5. Technical Report
- Ant Routing Algorithm
- Highly Dynamic Destination-Sequenced Distance-Vector Routing (DSDV) for Mobile Computers
- RFC 3626 (OLSR)
- RFC 4728 (DSR)
- ZRP Draft
- William Strunk, Jr. - The Elements of Style [in technical writing]
- FMM - Frequently Made Mistakes [in technical writing]
Task Summary

- Implementation of the specified protocol
- Documentation of all functions and data with Doxygen
- Evaluation of the protocol by experiments
- Measurement and evaluation of data
- Technical report
Measure the throughput of your protocol implementation. Consider the following parameters:

- Hop count, create different topologies
- Payload size, create packets with varying payload
- Inter-packet spacing, vary the time between sent packets
- Contending flows
Consider the following topologies:

Chain, one flow

Fully Meshed, contending flows
- Minimum of 7 pages, no titlepage
- \LaTeX, 11pt, double column, IEEE format
- Follow general guidelines, e.g., alignment of figures and tables
- Structure: abstract, introduction/motivation, your contribution, evaluation, discussion, conclusion, and bibliography
- Content:
  - General topic/task you have to solve and application domain
  - Routing approaches (OSLR, DSR, etc.)
  - Specified routing protocol in detail
  - Software architecture of implementation
  - Important encountered problems
  - No (or very few) source code
  - Elaborate testbed/experiment setup
  - Evaluation of measured data, figures and discussion

- No spelling, grammar, or punctuation mistakes!!!
