Exercises 10

1. *Ford-Fulkerson*

   (a) Use the Ford-Fulkerson algorithm to find a maximum flow in the network

   Start with the initial flow f. An edge label f/c means initial flow f and capacity c.

   (b) Find a minimum cut proving the maximality of the flow.

2. *Max-Flow Min-Cut Theorem*
   Prove the Theorem:
   For a network (V, E, s, t) with capacities $\text{cap} : E \to \mathbb{R}_+$ the maximum value of a flow is equal to the minimum capacity of an (s, t)-cut:

$$\max\{\text{val}(f) \mid f \text{ is a flow}\} = \min\{\text{cap}(S, T) \mid (S, T) \text{ is an } (s, t)\text{-cut}\}$$

   Hint: Show that the following conditions are equivalent:

   (a) f is a maximum flow.

   (b) The residual network G_f contains no augmenting path.

   (c) $\text{val}(f) = \text{cap}(S, T)$ for some cut (S, T) of G
