## Algebraic description

- ▷ Stoichiometric matrix  $S \in \mathbb{R}^{m \times n}$
- ▷ Rows  $\rightsquigarrow$  internal metabolites  $i = 1, \dots, m$
- ▷ Columns  $\rightsquigarrow$  internal and external reactions  $j = 1, \dots, n$
- ▷  $S_{ij}$ : stoichiometric coefficient of reactant  $i$  in reaction  $j$
- ▷ Set of irreversible reactions  $Irr$
- ▷ Metabolic model  $\mathcal{M} = (S, Irr)$

A. Bockmayr, Network Analysis, 22 May 2015

### 3. Flux balance analysis (FBA)

- ▷ Assume cellular behavior is determined by a certain biological objective.
- ▷ Determine a corresponding “best” flux distribution.
- ▷ Use mathematical optimization to predict phenotype.

- ▷ Simplest case: Linear programming (LP)

$$\max\{c^T x \mid Ax \leq b, x \in \mathbb{R}^n\}$$

- ▷ Flux balance problem (FBA)

$$\max\{c^T v \mid Sv = 0, l \leq v \leq u\} \quad (\text{FBA})$$

### 4. Flux variability analysis (FVA)

- ▷ Optimal solutions to FBA problems need not be unique.
- ▷ Enumerating all optimal solutions is computationally expensive.

- ▷ Alternative: Analyse flux variability

$$Z_{opt} = \max\{z = c^T v \mid Sv = 0, l \leq v \leq u\} \quad (\text{FBA})$$

For all  $j = 1, \dots, n$ :

$$\max\{\pm v_j \mid Sv = 0, l \leq v \leq u, c^T v = Z_{opt}\} \quad (\text{FVA})$$

### Example
